Notes

- (1) Although the recommended soldering conditions are specified in the above table, reflow or hand soldering at the lowest possible temperature is desirable for the LEDs.
- (2) A rapid-rate process is not recommended for cooling the LEDs down from the peak temperature.
- (3) Reflow soldering should not be done more than two times.
- (4) After soldering, do not warp the circuit board.
- (5) In soldering process, stress on the LEDs during heating should be avoided.

Soldering Note

- ① Please do not press the lens over 1.5kg.

Good

Impermissibility

- ② Please wear anti-static wrist or glove to prevent ESD damage when assembling.

Package Specification

Storage Cautions

1. Before use the LED package, the LEDs should be keep at 30°C or less and 65%RH or less.
2. Base on tube packing method, we recommend baking process before use LED go to soldering process. Baking process: 12hours at 65±5°C less., after baking process, The LEDs should be soldered within 168 hours (7 days) LED and same keep room condition at less than 25°C and 65%RH when soldering processes.
3. Please avoid rapid transitions in ambient temperature in high humidity environments where condensation may occur.

Application notes of LED

1. Base on high driving current conditions , the LED slug bottom must have good contact with heat sink. Please use high thermal conductive glue to adhesion between slug and MCPCB.
2. Extreme junction temperature caused either by excessive power dissipation, an abnormally high thermal path, or improper assembly can cause thermal overstress failures.
